Enterprise Omni-Agent AI Platform

Next-generation autonomous security platform combining AI-powered agents, real-time threat intelligence, and unified SOC operations into a single enterprise fabric.

What is Omni-Agent?

A fully integrated, AI-native cybersecurity operating system that deploys autonomous agents across your entire infrastructure — collecting telemetry, hunting threats, remediating vulnerabilities, and orchestrating response without human intervention. A single platform replacing five or more point solutions.

Core Pillars

Autonomous Agent Fleet — Self-healing, self-updating agents deployed on every endpoint. Agents execute playbooks, report telemetry, and participate in swarm coordination without centralised polling.

Unified SOC — EDR, SIEM, UEBA, and SOAR in one pane of glass. Correlated alerts from all sources reduce analyst alert fatigue and accelerate mean-time-to-contain.

AI Governance — The first platform to monitor, audit, and enforce policies on every LLM and ML model running inside the enterprise, including Shadow AI discovery.

Zero Trust & PAM — Continuous device trust scoring, privileged access vaulting with JIT access, and full session recording for every privileged operation.

Multi-Cloud CSPM — Connect AWS, Azure, and GCP for real-time posture management, automated misconfiguration remediation, and integrated FinOps cost visibility.

SOAR integrations

Autonomous Agent Management

Deploy, manage, and orchestrate thousands of autonomous agents across heterogeneous environments. Each agent independently reports telemetry, executes assigned playbooks, and participates in swarm coordination for distributed response operations.

Agent Registry

Full fleet inventory with health status, installed capabilities, version, and last-seen timestamps.

Swarm Mode

Peer-to-peer agent coordination enables distributed threat response without central orchestration.

Agentic Decisions

AI-driven autonomous decision making with configurable approval workflows and human oversight gates.

Remote Control

Real-time shell access, file browser, and process manager on any registered agent.

Goal System

Persistent goal manager drives long-running security objectives across agent restarts.

Network Topology

Live graph of all agent positions, connectivity, and resource utilisation.

19 Built-in Capability Modules

FIM — File Integrity Monitor	98%
EDR Real-time Telemetry	96%
Network Discovery & Scanning	95%
UEBA & Behavioural Analytics	93%
Vulnerability Scanner	97%
Runtime Security (eBPF)	91%
YARA Threat Hunting	90%
Software Management / Patching	92%

EDR — Endpoint Detection & Response

-  **Real-time detection** with IOC feed integration and behavioural rule engine.
-  **Automated quarantine** with one-click network isolation per agent or host.
-  **Per-agent drill-down** — telemetry timeline, processes, and file events.

SIEM — Log Management

-  **Centralised log aggregation** via Syslog UDP port 5140 and direct agent feed.
-  **Rule-based detection** with correlation across all log sources.

UEBA — User & Entity Behaviour

-  **ML anomaly detection** with per-user and per-entity risk scoring.
-  **Insider threat detection** with peer group comparisons and time-series baselines.
-  **Shadow AI tracking** — detect unauthorised AI tool usage through behavioural signals.

Threat Intelligence & XDR

-  **Multi-source threat feeds** enrich every alert with context and attribution.
-  **Kill-chain reconstruction** — MITRE ATT&CK mapped attack-path visualisation.

Privacy & Data Protection

- 

Privacy Dashboard — Unified view of data subject rights, processing activities, and consent states.
- 

DSR Management — Automated Data Subject Request fulfillment with deadline tracking.
- 

Breach Notifications — 72-hour GDPR workflow with regulator-ready templates.
- 

ROPA — Record of Processing Activities with data flow mapping.

Multi-Cloud CSPM

- 

Connect AWS, Azure, GCP — Real-time posture management with auto-discovered assets.
- 

Automated Remediation — One-click and policy-driven misconfiguration fixes via cloud APIs.

AI Governance & LLM Oversight

The first platform to govern not just infrastructure but every AI system inside it. Monitor, audit, and enforce policies on all LLMs and ML models.

-  **AI Systems Registry** — Inventory of all AI models with risk classification and owner attribution.
-  **Governance Policies** — Acceptable-use policies enforced at the LLM proxy layer before every request.
-  **LLM Proxy Audit** — Full audit log of every prompt and completion across all AI providers.

CLAUDE API

OLLAMA

AZURE OPENAI

SOAR & Playbooks

-  **AI-authored Playbooks** — Version-controlled library with drag-and-drop visual builder.
-  **SOAR Execution Engine** — Full execution audit trail across 200+ integrations.
-  **Automated Quarantine** — One-click network isolation and account lock from any alert.

Zero Trust & PAM

-  **Device Trust Scores** — Continuous posture assessment drives conditional access decisions.
-  **PAM Vault** — Privileged accounts with check-in/check-out, JIT access, and session recording.

Platform Architecture

One-Command Deployment

sudo ./run-on-ubuntu.sh

Full backend, frontend, agent, and database setup on a fresh Ubuntu 22.04+ server. Provisions systemd service units with auto-restart, UFW firewall rules, admin seed data, and XDR playbook seeding — all in a single script execution.

MongoDB, Python 3.11 virtualenv, Node 20 npm production build

UFW rules: 5000 (API), 3000 (UI), 5140/UDP (Syslog ingestion)

`sudo ./install-agent-linux.sh --backend-url URL --as-service`

Executive Reporting Suite

Comprehensive automated reporting across all security domains with scheduled delivery in PDF, XLSX, or HTML formats.

-  **Executive Summary** — Board-level posture dashboard with trend analysis and KPI tracking.
-  **Vulnerability Exposure** — CVSS-ranked remediation report with SLA countdown timers.
-  **Scheduled Reports** — Cron-based delivery to custom recipient lists across formats.
-  **Change Management** — Full infrastructure change audit with approval workflows.
